

Virtual Private Cloud (VPC) Network

TOTAL POINTS 2

1. True or false? In Google Cloud VPCs, subnets have regional scope.

1 / 1 point

- ☒ True
☐ False

Correct

That's correct. VPC subnets can span the zones that make up a region. This is beneficial because your solutions can incorporate fault tolerance without complicating your network topology.

2. True or false: If you increase the size of a subnet in a custom VPC network, the IP addresses of virtual machines already on that subnet might be affected.

1 / 1 point

- ☐ True
☒ False

Correct

That's correct. You can dynamically increase the size of a subnet in a custom network by expanding the range of IP addresses allocated to it. Doing that doesn't affect already configured VMs.
